Working Paper #93-002 March, 1993

Implementation of the

Interview Scheduling System

for Miami University 's

Career Planning & Placement Office

Steven J. Peter

Dept. of System Analysis
Miami University

Abstract

This project is an extension of systems analysis and design covered in two classes – SAN 472/572 (Analysis of Information Systems) and SAN 475/575 (Structured Design and Implementation). My implementation involved work in the areas of integrating a subset of the system, designing a multiuser accessing means, investigating database security, implementing dynamic calls, setting–up a database load facility, and researching laser printers and forms software. The integration involved getting the system to an operational state as opposed to a production state. Multiuser access to the system will be permitted to about 2600 Seniors and accounting Juniors. The students will be permitted to access the system simultaneously, and SQL will provide the concurrency control. The database security will be upheld by offering authority privilege to the program instead of the users. Dynamic calls will be used to maintain a reasonable virtual machine size. A database load facility will be used by the DBA at the beginning of every year to load demographic data pertaining to students. The standard resumes will be printed by the CPPO and that will require a new laser and a forms software. Research has been completed for various lasers and forms software, and a recommendation is given. The final portion of the paper presents some oft he benefits that I have obtained while working on this project.

Implementation of the

Interview Scheduling System

for Miami University's

Career Planning & Placement Office

Steven J. Peter

December 18, 1992

CONTENTS

Introduction

The interviewing process at the Career Planning and Placement Office is something with which I am familiar. After my undergraduate graduation my first job was obtained through the office, and while working toward my masters degree, I have used the facility to apply for internships. I have also come in contact with the CPPO through two classes which included a study on creating a computerized operation for the department. The courses were SAN 472/572 (Analysis of Information Systems) and SAN 475/575 (Structured Design and Implementation).

For my graduate project, I have made it my interest to expand on the work completed by these two classes. The project background and my accomplishments are presented in this paper.

Background

Richard Hearin, the Director of the Career Planning and Placement Center at Miami University, submitted a request for system services. He wanted to redesign the CPPO's current manual system. (For information of the current CPPO System, one should refer to the Placement Registration and On Campus Interviewing Procedures which can be obtained throught the CPPO.) But, in his request, he specified the current problems with the current scheduling sytem as follows:

1. Students place bids on companies that they would like to interview. To place a bid, the student must come to the CPPO which is a fifteen minute walk from central campus. These bids are placed within a twenty four hour period, exactly two weeks prior to the company's on-campus interview. Additionally, those students who win the right to an interview, must come to the CPPO to present their standardized resume (called the Placement Data Sheet) and sign up for the interview.

Both the bidding and sign-up process consume student time. For the vast majority of students, the trip to the CPPO is significantly out of their way. And in some cases, a sign-up can involve a lengthy wait in line because there are only two sign-up stations.

2. The current WANG processing system does not have any database capabilities; it is used in a word processing capacity to store some information on students and to record who is interviewing at given interview times. As a result, needed information cannot be readily obtained.

3. CPPO personnel spend much time determining who the winners are for interviews. The student bids, which are on 4x4 inch sheets of paper, have to be manually

sorted in descending order by bid amount.

4. CPPO personnel also spend time gathering the Career Planning and Placement Sheets for specific interviews. CPPO staff must manually put together a packet for each employer. And the whole process is spread over weeks. First the students have to bring in their data sheets, and the staff places them in folders. The day before the interview takes place, the packet is assembled. Up to thirty packets a day are constructed. They are needed at 8:30 A.M.

5. The personnel also gather the Career Planning and Placement Sheets for companies requesting information on students with certain criteria. There are approximately 2100 sheets to examine.

6. CPPO personnel are interrupted by students wanting to know their status with the CPPO or the bid points that they have left.

Rich Hearin indicated that he wanted a system which would enable the students to register with the CPPO, make bids, receive results and sign-up for interviews without having to physically come to the CPPO. In addition, he would like to be able to produce interview lists (a list of companies coming on a day) and copies of the Placement Data Sheet for each interviewer automatically. Finally, the new system should be able to to produce the data sheets of students who meet certain criteria.

In 1992, the students of SAN 472/572 approached this proposal and performed the system analysis on the project. The survey, study, and definition phases of the case determined that the project was a necessity and that the implementation of such a system was possible. Such a system should be able to perform the following events:

1. Registration and scheduling of employers (300/yr)
2. Registration of students with CPPO (2600/yr)
3. Student bid processing (15,000/yr)
4. Scheduling of interviews (300/yr).

The system should provide the following outputs:

1. Student registration and eligibility status
2. Recruiting Schedule
3. Interview & Requirements Schedule
4. Interview Bidding Results (listing of all bids submitted)
5. Master File Name Listing
6. Updated Master File Listing (sorted by Social Security Number with names)
7. Updated Master File Listing (without names)
8. Alpha Listing of Students (whose bids were accepted).

The beneficiaries of a new system will be both the students and the employees. A cost benefit analysis of a new system suggested that the benefits are intangible. The new system cannot result in any increase in income or decrease operation costs but may allow staff to dedicate work in other meaningful areas and will significantly save student time in the registration, bidding and sign-up process. Also, another intangible benefit is that "rush hours" relating to open sign-ups can be eliminated, and hence, work flow will be more evenly spread out for staff. Also, a new system will eliminate the human error that can occur in processing bids or selecting Placement Data Sheets.

The costs of a new system are more concrete. Any new developed system would have to be achieved on existing mainframe hardware. There will be an additional cost of a few personal computers and a laser printer. All and all, with the benefits and costs

determined, the SAN 472/572 class recommended that the project be implemented so that such improvements can be made in the interviewing process at Miami University.

Prior System Design

In the subsequent course, SAN 475/575, the design aspects of this case were considered. The database was designed using SQL. The entity relationship diagram for this design can be seen in Figure 1. Some screens were designed and implemented under XMENU. A system hierarchy of programs and modules was established. Programs were written in COBOL using embedded SQL and in most cases were designed using a similar module format offering familiarity for ease of maintenance.

There was no completed driver with this system; so these programs could not work in concert. Additionally, the system designed in this course was not a multiuser system which would allow many users to utilize the same applications and database at the same time.

Implementation

An Overview

My role in the project was to take the most important subset of the system to an operational state and also to research some special issues not yet addressed that would have profound effects on the system. The portion of the development cycle not yet complete was the integration of the separate modules into one larger module, the database construction and changes inside programs. The important issues not yet addressed for this system were multiuser access, database security, dynamic vs. static calls, laser printer and forms software purchase options.

My first work on the system was to integrate the modules written by the design class. Each module had been previously tested as a "stand alone" unit. But since the time that these modules were written, there were changes to screens, screen fields, the DFHCOMMAREA (the area where global variables are located) and to the database. So each module required detailed adjustments just to compile.

At the beginning of this semester, we had no active database in place. We had a database design from the previous class. I began to create the database that we had devised. It included five relations shown in Figure 1: STUDENT, EMPLOYER, SCHEDUL, INTERVIEW, and BID. These relations were required because of the embedded SQL that existed in all programs except for the driver.

My concentration was on six modules. Their relationship to the overall CPPO system can be seen in Figure 0.5. This figure shows the screen heirarchy of the system prototype and the previously mentioned six modules are related to these screens. The subset of the system that I concentrated on is indicated by circles on the figure. An overview of the six modules and their functions are explained in the following illustration and paragraphs.

Module Name	Description
CPPOCICS	is the driver.

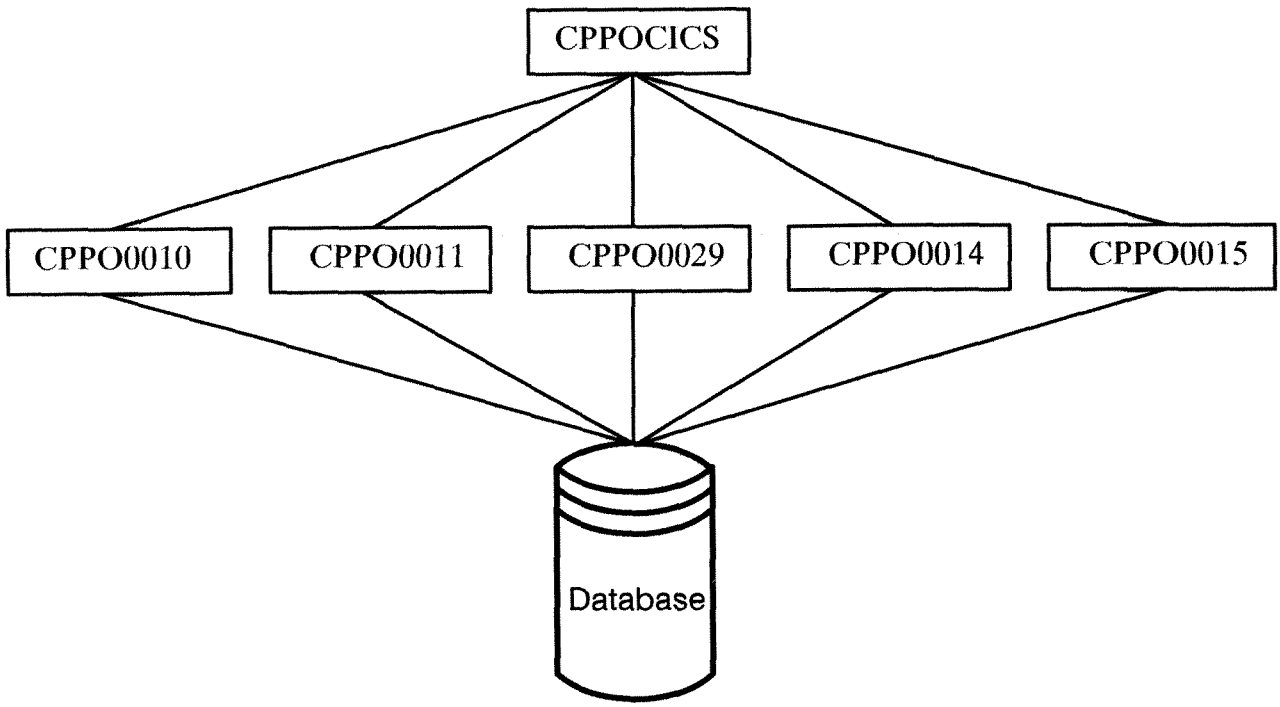
System Submodule Name	Description
CPPO0010	shows companies that the student is eligible to interview.
CPPO0011	produces more information about a specific interview; can place bid here.
CPPO0029	processes the bids for a company visit.
CPPO0014	presents the status of the student's bids.
CPPO0015	selects an interview slot.

The driver, called "CPPOCICS", contained no embedded CICS. Because of CICS's influence in industry, we wanted to use it. But we had to simulate true CICS because our operating system did not support it. The other modules were CPPO0010, CPPO0011, CPPO0029, CPPO0014, and CPPO0015. I will refer to these submodules as "system submodules" because there are other submodules that are associated with screen map presentation.

CPPO0010 is the module that presents the student with a listing of companies for which they are eligible by meeting their company requirements. The module's associated screen is SCRN1120. [See Figure 4.] Some changes were made to the fields of this screen. One improvement was to eliminate the individual fields across a screen line and make one screen line just one field. This reduces the amount of MOVE statements needed in CPPO0010; the whole record is moved to the screen field instead of many variables being moved to many screen fields. When the screen is displayed the user can select a given company to obtain more information about that company by entering the line number of the company of interest. By doing so CPPO0010 will move "CPPO0011" to the global variable, Next-Program-Name. Control goes back to the driver where CPPO0011 is called. Its associated screen is SCRN1121. [See Figure 5] Here, a student will see more information about an interview and will be able to place a bid.

Once the bids have been placed and the final bid date has passed, the bids can be processed. Module CPPO0029 processes the bids in the BID relation, revises the bid point fields (the amount that all bid winners are charged for a given interview) in the VISIT relation, changes the status of the visit, and updates the field in the STUDENT relation that holds the students remaining bid point balance. [See Figure 6 for the related screen and see Figure 17 for a before & after instance of certain relations] For a student to view the outcome of his bid, he would press the PF7 Key while at the screen, SCRNCICS. [See Figure 3] That action will take them to the CPPO0014 which will display SCRN1140. [See Figure 7] If a student becomes a bid winner, they can opt to proceed to the screen where they may select an interview slot. They enter the line number in the entry field, and the next program name is passed to the appropriate global variable. Control goes back to the driver where CPPO0015

will be called; CPPO0015 has the related screen - SCRN1141. [See Figure 8] Here the student can view the interview slots available for the company visit. They are able to select a slot and can even cancel a selection up to 9 A.M. the previous day of the interview.
A diagram of the relationship of my implementation is shown below.



The Integration

The driver was the first program that I updated. It did not have any embedded SQL so it did not rely on the database. Program name references in the calls to submodules had changed since the writting of this program. The DFHCOMMAREA had to be revised because each module was using different global variable names. The DFHCOMMAREA is the "01" level variable definition that the class used in the "Linkage Section" of our submodules. The name "DFHCOMMAREA" was used because it has significance in CICS. In CICS it is known as a "communication area" where the global variables are declared. In the system submodules, the class used the name DFHCOMMAREA to declare the variables that would enter the system submodule.

I also began work on the system submodules. In preparing the system submodules for compilation, the global variables between each system submodule and the screen submodule had to match. The screen module pushes the screen map to the monitor. Since there were name changes to screen fields and changes to the arrangement of the of related variables in working storage of the calling program, linkage adjustments had to be made. The code for the screen programs was produced by a code generator which would set the screen variables under DFHCOMMAREA. The record layout for the DFHCOMMAREA was fixed by the code generator. Therefore, it was easiest to change record layout of the system submodule.

After a successful compilation, the driver could not run with all options available until

all the called system submodules were in an executable state. Since the system submodules contained embedded SQL, the database had to be fully set-up to an operational state. Then there were changes to the system submodules. The changes to the system submodules were mostly in the areas of matching of the DFHCOMMAREA to the calling program, correcting the record layout of the global variables passed to the called screen program, an update of the embedded SQL, or as in one case, a total rewrite of the program logic. The rewritten program was CPPO0029. The transfer control portion of the driver had to also be written.

Once a module was completed, some verification of the program had to be performed. However, this testing was not extensive because it was not my objective to bring the modules to a production state but to bring them to an operational state. Under this verification, questions like the following were addressed. Did the queries select the correct data and display the information correctly from my limited number of test cases? With the screen displayed could the user page forward or backward? In most cases, there were quite a few corrections that had to be made. In the end, the package was operational which completed this phase of the project.

Database Load Facility

In testing the subset of the system that I had integrated, it became necessary to restore the database to its original state for retesting. Setting-up a reload facility for the CPPO database would also be important to the other student designers, and the technical support at the Computing Center. The support at the Computing Center will use the reload procedure to load demographic data that they obtain from the registrar to the STUDENT relation. This procedure will take place prior to the beginning of the academic year. The data that they will get from the registrar will exist in a sequential file format.

I have sent a copy of the STUDENT load facility to Bill Miley at the Computing Center for his use. At this time, all the attribute names are current, and the data in the data file has been laid out; so there is a guide for data placement in the sequential file. But everytime there is a schema change to the database, these load files will have to be updated.

Multiuser Access

Multiuser access was another issue addressed this semester. The question was, "how were we going to have multiple users access the CPPO System simultaneously?" In our virtual environment every "academic" user shares the level of the operating system known as VM. And each of these users will have an additional level of the operating system known as CMS in their virtual memory space. Similarly, the CPPO System would be resident in each CPPO user's virtual machine. And because of the many active copies of the CPPO System, we were also concerned about concurrency control.

There were four design options for our multiuser interactive system. The first option

involved a fixed number of of userids. The userids would be given names ranging from CPPO01 to CPPOnn where "nn" is the final number. A student who was interested in accessing the system would have to type one userid. If it is being used, he would try another until they found one that was open. The disadvantage of such a design is that it is clumsy and unprofessional. The advantage is that this design is easy to implement.

Another option was to have dedicated terminals set-up in various places. To access the system a user would sit down at the dedicated terminal. The student would just have to enter their personal identification number to the first screen of the system. Once again, this system would be somewhat easy to implement. Such a design would not require a change to the operating system. It would demand the creation of an active program that will monitor the dedicated serial ports and issue the system to those terminals. One disadvantage is that the system access is limited to those geographical areas where the dedicated terminals are located. And if the system goes down, a knowledgeable operator would have to be present to re-establish the system connection.

The third option involves a rotary style design. The underlying design is similar to that of option one, but the with the rotary feature. The rotary feature would allow users to logon to the system by issuing (at the userid prompt) one common userid that is associated with the system. There would be a maximum number of users that could access this system ranging from one to "nn". But the operating system would, behind the scene, find an available account so that the user would not have to attempt numerous logons as in option one. The major disadvantage with this design is that it necessitates a change to the operating system which can have unexpected occurrences.

The fourth option will be made possible by some policy changes made at Academic Computer Service (ACS). The new policy will be that all new students to the university will receive a userid that will remain theirs while they are registered. This userid will remain the same until the student graduates and no longer is registered at the university. The student would logon as he does now. First he issues his userid and password. Then he issues the class as "a" and the terminal type as "vt100." That will put him at the operating system command line at which he can issue the transaction name that will start the system.

This design becomes possible because ACS no longer will be as concerned with how many users are on the system at one time. The reason is that the maximum number of all-purpose users is roughly limited to the amount of terminals that the university has. In a meeting with John Kinney, Steve Moore, Dr. Schaber and myself, it was determined that if there are a great number of CPPO System users then this situation would be satisfactory and would not present a problem.

As for the concern about concurrency control of the database, SQL will provide the safety measures while in critical regions. SQL can multitask. Therefore, there is no concurrency control problem. The only other obstacle that we wondered about was whether there would be a possible database security breech by giving users access to the operating system command line. This topic is covered in the next section.

Database Security

Of major importance to those involved in the design and implementation of the CPPO System is the issue of database security. Students must be prevented from changing the database for their own benefit such as giving themselves more bid points. Additionally, students must be prevented from observing sensitive information about others.

At first, Steve Moore, Dr. Schaber and I thought that we may have some trouble in this area if we went with the fourth design option which would allow CPPO users access to the CMS command line. Our concern was that each registered CPPO student would have been granted authority privileges to access the system through one of the following commands: GRANT SELECT ON BID TO PUBLIC, or GRANT UPDATE ON BID TO PUBLIC.

Granting such privileges would allow a user to change the specified relation. But we discovered another way to grant privileges to the system, leaving user access from outside the system impossible. The solution is to grant privilege to the program; then only the program can examine or update the database. Such an example is GRANT RUN ON CPPO0010 TO PUBLIC. In this way, a user having the module CPPO0010 running in their VM space (and only under this condition) could indirectly access or update the database. Dr. Schaber and I tested this command from our DBA account. We then went into my account and ran the system which accesses the database. Embedded queries were allowed access. Then we exited the system and entered QMF where we tried to access the database. We were unsuccessful in accessing the database.

Once the GRANT command has been issued, it is a good idea for the DBA to check the meta-data associated with each relation. We are interested in who has been granted privileges for each of the relations in the database. This information can be found by issuing a query to the system table called SYSTABAUTH. The query is : SELECT * FROM SYSTEM.SYSTABAUTH WHERE GRANTOR = *'dba's id'* AND TTNAME = 'BID'. The result of the query may be:

GRANTOR	GRANTEE	GRANTEETYPE	SCREATOR	STNAME	TCREATOR	TTNAME	TIMESTAMP
SPETER	CPPO0010	P	SPETER		SPETER	BID	1992-11-20

The userid of the DBA would show under the GRANTOR field. The program was the recipient of the grant, and the GRANTEETYPE shows "P" which stands for program. A blank would indicate a user. TTNAME indicates the relation to which the program has privilege.

From this, the question arises, what is to prevent a student from issuing this "select" statement to find out what the name of a program is? And once they have the program name, what is there to prevent them from gaining access to the relation by writing a program using the same name with embedded code in their virtual machine. The answer is that a user will not be able to complete the preprocessing of the program unless the individual has been granted authority privilege to the relation.

Dynamic Vs. Static Calls

When I initially integrated the system modules I used a static link. As I added more system modules to the driver, the load time increased. [See Figure 9.5] With just six system modules and the associated screen modules, the load time was becoming significantly long. This consideration raised a concern as to what the results would be when the whole system was integrated. The overall estimate for system submodules is sixty. There was concern over what the effects would be on virtual machine size and load time. Of course the size of VM could be expanded, but with many CPPO users, a vast amount of memory would be required. I had to look into dynamic links.

With the new linkage, the driver would be dynamically linked to the submodules. But the submodules would retain their static link to their associated screen programs. There was no reason to call the screen programs dynamically since each system submodule usually possessed one screen module. The static linkage between a system module and one screen submodule uses a small portion of the virtual machine. This smaller load will allow the technical support staff to set a smaller virtual machine. The smaller the virtual machine, the more users can access computer services. Hence it is beneficial to have the system modules called dynamically, and the screen modules linked to the system modules statically. [See Figure 9]

So I investigated what was needed for dynamic calls. Recall, that all calls to system submodules were located in the driver, CPPOCICS. To convert the system to dynamic, two types of changes were needed. The first change was on the call statement itself. The second adjustment was a change in the compiling options of the compiler exec. After the code changes, each system submodule would have to be recompiled. At that time, the system would be ready to run dynamically.

A static call statement followed the format where the name of the submodule was bound by quotes in the CALL statement.

CALL *'program-name'* USING *a-list-of-variables*.

The dynamic call requires that the submodule name be moved to a variable name prior to the call statement. That variable would be present in the call statement. A CANCEL statement is used to release the memory used by the dynamically called module.

MOVE *"program-name'* TO *variable-name*.
CALL *variable-name* USING *a-list-of-variables*.
CANCEL.

Next, the compiling options needed a change. The options are located in the compiling exec shown in Figure 10. The fifty first line of the file is the crucial compiling line. This exec is set for a dynamic compile as shown by the "DYNAM" option. A static compile will have "NODYNAM" specified, or no specification at all, for which the default takes over as NODYNAM. With this alteration, the system submodules are ready for compilation.

With the linkages transformed, I thought it would be important to verify the dynamic memory usage. With a dynamic linkage, I would expect two results. First, the system execution should be slower since the called system submodules are not resident in memory. It takes time to load these modules into memory. Second, under a dynamic linkage, there should less virtual memory space used because the submodules are brought into memory when needed and discarded when complete.

To help provide information relating to the above assertions, there are some CMS commands that can be typed at the command line. To find out the size of a virtual memory,

the command STORMAP will provide this information under the VMSIZE field. Figure 11 shows the output result of this command. The size of virtual memory is four megabytes.

Another command is STDEBUG. This command can help monitor the amount of memory being used. To obtain the information about memory usage and time, the following commands should be issued as such:

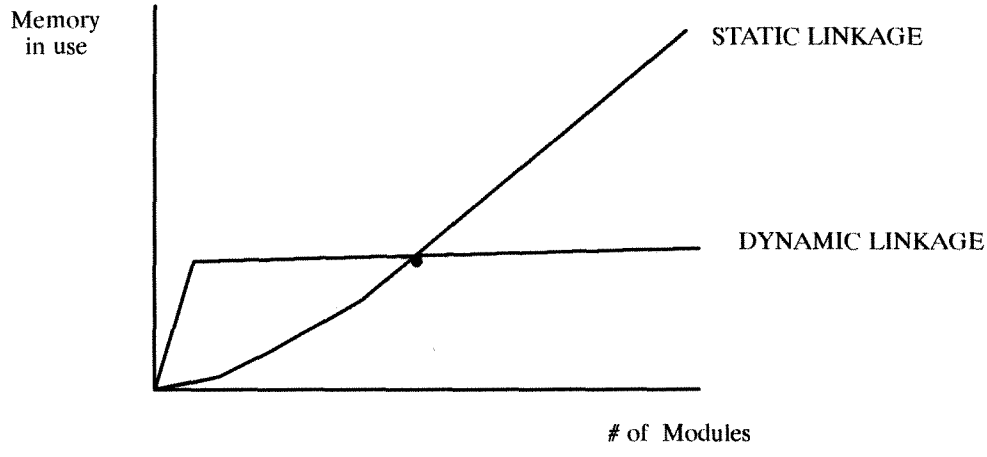
```
STDEBUG (OB REL FROM 0-40000 PUNCH D
LOAD program-driver-name
START
STDEBUG (END
SPOOL PUN CLOSE
Q FI
Q PUN ALL
TRAN PUN #### * R
RECEIVE #### filename
```

The first line initiates the action. The parameters specify that a record is to be created every time memory is "obtained" or "released." The second and third lines are typical commands used to initiate a program. For *program-driver-name* in the second line, I use the name of my driver - CPPOCICS. The program will run interactively, and the user can respond to the system. When completed and out of the system, the fourth line gets entered which will stop the memory monitoring process. The fifth line closes the punch. The sixth line finds the punch. The seventh issues a number. That number is used in the next line so that the output can be read into the user's reader. Finally the receive statement will allow the output to be placed in a named file. For more details on these commands, type HELP *command-name* at the operating system command line. "HELP" can assist with syntax and other options.

The static and dynamic output can be seen in Figures 12 and 13. Figure 12 is the output for the static run. Figure 13 is the output for the dynamic run. Column one of the output gives the time of the run. The same procedure was used under both static and dynamic runs. There were no delays between keystrokes which could add time to a test run. The procedure was to load the CPPOCICS module and respond to the driver screen by hitting the PF4 key which calls the CPPO0010 module. As soon as the companies were displayed, a "1" was typed in the entry area, and the PF4 key was pressed. Control goes back to the driver and the next program is called - CPPO0011. When the next screen was displayed the back-out key, PF3, was hit until I was out of the system. Total time is equal to ending time minus beginning time. As expected the dynamically linked modules took more time.

The next column of output specifies when memory is obtained or released. The amount of memory obtained or released is shown in bytes in the third column. At first look, the results were not what I had expected. I had observed that the dynamic linkage was using more memory space. Since then I have learned that there is an associated overhead with dynamic calls in CMS. If you look at Figure 13, you will see that early in the run their are some large amounts of memory obtained. The bytes in hex are 2000 (8192 in decimal) and 2010 (8298 in decimal). These large acquisitions are not found in the static run, but there are some similarities. The first four byte acquisitions in the static run can apparently be found in the dynamic run in lines four, nine, fourteen, fifteen and sixteen. But nothing can really be ascertained from this test about memory usage, because the static load is so small that the static results are not realistic. This static load consisted of six system modules and the screen modules associated with them. This would be a very small percentage of the real CPPO System

once it is complete. With a load of hundreds of modules, the memory usage should be much greater than the same system set-up dynamically. And the large dynamic system should have results similar to the small dynamic test that I ran. An illustration of this explanation is given below.



Hence there is an associated fixed cost of dynamic linkage and a breakeven point in the relationship between static and dynamic linkage. In my case, the number of modules fell quite short of this point, and the dynamic memory use exceeded the static memory use. But in the finished CPPO System, the dynamic memory use should be quite less than the static.

Aside from this test, there is another way to verify that the dynamic linkages did take affect. And that is to examine the load map once the dynamic driver has been loaded. The map should not list the system submodule system names (CPPO0010, ect.), whereas the static load map will have these program names. The two load maps can be examined in Figures 14 and 15. Since the dynamic load map did not have this submodules listed, the dynamic linkage was implemented correctly.

Desktop Laser Printer

Another area of the project that needed some research was the printing capabilities of the CPPO. Given that the CPPO was going to print the Student Placement Data Sheets, there had to be a way to print the standardized resumes. I investigated printer possibilities.

In addition to the necessity to print the standard resume forms, the CPPO also needs a laser that has the capability of printing clear text and graphics in a reasonable speed and forms capability. A reasonable speed is six pages per minute. The laser must have enough memory to hold the form image during the merge of the data and form. And lastly, it should have an interpreter program that can work with the most common page definition languages.

In consideration of these requirements, I found that the desktop laser, as opposed to the larger faster network printers, is what the CPPO needs. The desktop is perfect for the needs of a small work group such as the CPPO. Also for the user who has high volume of printing, the desktop can be set up as a dedicated printer.

There are several lasers to consider in this category. In November 1992, PC Magazine came out with its listing of mainstream lasers, those that print four to ten pages per minute. The six top lasers with their list prices that they recommend are:

Fujitsu Print Partner 10	$1,995,
Kyocera Ecosys a-SiFS-1500A	$2,395,
IBM LaserPrinter 10P	$3,795,
NEC Silentwriter Model 95	$1,749,
HP LaserJet4	$2,199,
HP LaserJet4M	$2,999.

The Fujitsu Print Partner 10 offers great speed at 10.1 ppm for text output. This laser doesn't have the complete network options that the HP's and the IBM has. Its base memory configuration is 1MB of RAM. It does have the ability to automatically switch fonts without having to switch a cartridge. The output is only 300 dpi (dots per inch) which is not that competitive in the market considering several of the above lasers can print at 600 dpi. And on a resume form, quality is important.

The Kycocera Ecosys a-SiFS-1500A offers low costs per page and supports environmental concerns by offering a drum that never needs replacement. Additionally, to assist with the environment, there no longer is the replaceable toner cartridge. Just the toner powder is replaced. The printing resolution is 300 dpi, which is not as sharp as needed for a resume form. The standard printer without upgrade comes with 1 MB of RAM which is less than some other laser printers.

The IBM LaserPrinter 10 was last year's "Editor's Choice." This year's IBM possesses many of the same features. The IBM is provided with 2 MB of RAM. It uses the Adobe PostScript as its standard font. It is possible to switch font automatically. It has a parallel port which is faster then a serial port because it sends one byte at a time as opposed to bit at a time. Most PCs have both a parallel port and a serial port. The inclusion of a parallel port enables the IBM to offer an automatic shut-off when the bin is full. In terms of text output speed, it is quite fast at 8.8 ppm. Of course, with graphics, the output rate would be slower, but the ability to print complex graphics is not pertinent, since the main need of the laser at the CPPO is for the printing of Placement Data Sheets. The output is top quality; it is produced at 600 dpi. But the HP lasers are slightly better when it comes to print resolution.

The NEC Silentwriter Model 95 has the lowest list price among these six that have been recommended. The standard printer comes with 2 MB of RAM. It prints at 6 ppm. The resolution is 300 dpi. It does support the page definition languages - Adobe PostScript Level 2 and PCL 5. It also has a fax option. But it is important to have resolution at 600 dpi.

The HP lasers use an improved version of PCL 5 which allows for 600 dpi printing (which is more important for graphics printing). They also have a new Canon engine (model P-270), the introduction of a RISC processor (to increase speed by reducing the number of instructions), and a quick parallel port which speeds up communication in both directions. Included with the HP lasers is a second paper tray. There is thirty five Intellifonts and ten TrueType fonts. The LaserJet 4M includes true Adobe PostScript Level2. Also included is HP's Resolution Enhancement Technology (RET) on both lasers. The 4M model has 4 MB of RAM. One changed added this year is the ability to change emulations automatically. Older HP lasers required various cartridges to be inserted to get PostScript fonts or some other desired font. LaserJet 4 is about $200 less than the LaserJet III which printed at 300 dpi. The performance of the HP laser on a small or medium sized network is good. HP does present the network option of JEtDirect network

interface cards for Ethernet and Token-Ring networks.

Reliability of a printer is of major concern. PC Magazine surveyed 18,130 of its readers and found the following results.

Manufacturer	% who had no repairs
Brother International	57
Canon,USA	58
Citizen America Corp.	62
Eastman Kodak Co.	60
Hewlett-Packard Co.	50
Epson-America	58
Panasonic	66
Star Micronics	67
Tandy Corp.	55

Although, these results pertain to all types of printers, they can be used in a general fashion to ascertain the reliability of laser printers. Note that the Hewlett-Packard registers on the list. None of the other recommended laser manufacturers are shown on the table. This is a positive attribute for the determination of what laser should be purchased. Also in Hewlett-Packard's favor is its new high resolution.

The reliability and quality of the printed output, causes me to recommend a HP laser in the four series. The HP's produce output at eight ppm. Hence, it will take the CPPO 65 minutes to print the daily Placement Data Sheets (based on 20 interviewers a day, each with 13 interviews and two data sheets per interview). Finally, retail prices are much less than list; an HP LaserJet4m can be purchased for less than $1,800.

I feel that the CPPO will need to purchase just one laser. They have a relatively new laser that is one year old, and it can be used when the newly purchased model breaks down. This model is Hewlett-Packard's LaserJet III P. Its quality will not be as good because it prints at 300 dpi. But for a back-up situations, this quality can be acceptable for a short term.

Forms Software

We wanted to keep the original design of the Placement Data Sheet, so an Electronic Forms Package will be needed to store the form and various "form letters." As for the Placement Data Sheet, the data relating to the student can be combined with the form to produce the finished Data Sheet that can be presented to the employer. The CPPO will need to print two data sheets for every interview on campus. Upon the request of an employer, the CPPO will also need to print data sheets of students that meet certain requirements.

So what is needed is a forms software package that will allow the CPPO to automate the job of taking the student data from the database (or downloaded database) and combining it with the form to produce the data sheets. More specifically, the form design is stored in the laser printer memory. A crucial part of this relationship is the laser printer itself because of the need to store the form in its memory. With the HP LaserJet, the PCL codes (that outline the details of the form such as lines, boxes, ect.) are resident in memory and sent to the output as a macro overlay. This overlay gets printed over any data sent to the printer. Since this overlay remains present in the laser memory and does not have to be downloaded to the printer each time, it actually takes less time to print repetitious, completed forms.

In the November 12, 1991 issue of PC Magazine, five forms software packages are presented and compared.
They are:

Form Publisher with Fill & File	$195,
FormGen Plus	$279,
Form Base	$495,
JetForm-Design	$495,
PerFORM Pro	$495.

Form Publisher with Fill & File is the most inexpensive of the reviewed group. It offers a complete assemblage of design tools, but the product is unsophisticated. One thing nice about the product is that simple forms are easy to create. With such form creation there is not a great amount of complexity placed on the user. But copying or creating an existing form is a difficult function, that takes a long time. The copying of such a form may require some concessions. The software does allow for the form design to be seen on the monitor. One disadvantage is that the product has this tape measure device which is only in inches. It is hard to set many lines per inch, and "clicking" on small objects is difficult. As for printing speed, the product upholds an adequate printing speed. The major disadvantage is that the form may not print as aligned on the monitor or some options selected in design may not show. And hence, it is these type of deficiencies relating to this product that warrant the non-consideration of this product for the CPPO.

FormGen Plus is also on the inexpensive side but it does the basic job. According to the editor, the attempt of creating a complex form for them cost several days, and in the end they could not produce the form. Also once a form is saved, screen-lockouts are put in place, and the form cannot be changed. Different thickness of lines cannot be used in a form. The product allows for quick printing, but it is the troublesome creation characteristics that prevent the recommendation of this product.

FormBase is good in the area of database management; it has its own proprietory

database. Data can still be imported from ASCII text though. It drawing abilities are limited. There are no tools for drawing; resizing cannot be done, and complex forms are difficult. Printing production is at the low end of these reviewed products Also, a company helpline is offered for only the first 60 days after purchase. After that, the user must purchase a service contract which costs $100 for individuals or $1,000 for corporations. The other option is to call the 900 line which costs fifteen dollars per call. The lack of support for the customer is a real disappointment for this product.

Of the five, PC Magazine recommends two – JetForm–Design and PerFORM Pro. The two offer many of the same features. Both have a screen design features and further, each will accept a form that has been entered via scanning device, a feature that may be useful as a future enhancement to the system. Both are able to take care of data application. Both provide quick printing. Both products support a feature called forms fill–in, a feature that allows for data entry through the screen form image. The forms fill–in could be another future enhancement to the system. As for data entry, both products offer entry modes of character graphical. Each has the ability to verify data entered and to run calculations. It is possible to merge data and forms in batches with these software products. This process can be issued from the DOS command line. But for PerFORM to achieve this function there would be an upgrade with additional expense.

JetForm is also recommended but for large corporations with a multitude of form needs. The overall package consists of the combination of several software products. One product is known as JetForm–Design which is used in form creation, and another is JetForm–Filler which allows for the "fill–in" and printing of forms. The product does support some field validation rules, but these are not covered sufficiently in the manual.

The design features associated with this product are good. It facilitates quick and easy form design. The user can duplicate existing forms or objects. Small objects are manageable with the zoom feature. Measurement can be in several units: inches, millimeters ect. A wide range of fonts are available. One disappointment is that objects cannot be resized once drawn. JetForm does support network features by allowing the forms to be stored centrally. The forms can be used by many users whether their work is mainframe or minicomputer based.

Once a form is compiled, the process of printing the forms involves use of the Filler program, which combines the data and the form. The process is fast because once the form is in place (in printer memory) only the data needs to be sent to the printer. The data can be in ASCII format. The JetForm requires a 386–based PC with 2MB of RAM and 2.5 MB of hard disk space. It can run on releases later than DOS 3.1 or Windows.

PerFORM also has modular structure. This modular separation allows for user separation from the design facility. Other components of this product include its network accommodation, excellent form design facility, and a management database. PerFORM allows for the application of an encrypted user signature an interesting feature. As mentioned earlier, PerFORM also provides the form fill–in element. Forms can be printed from an ASCII file. But the product does not "have a built in script language." Apart from JetForm, it has a resize feature and the ability to move objects to the front or back. It has the potential to show or suppress boarders, file locking, database record locking, digitizer support, some additional graphic formats (EPS, GEM, .IMG), more predefined lines widths, arrows, shades and colors, pop–up query boxes and database indexes. It requires at least a 386–based PC and 2MB RAM with 3–5 MB of hard drive.

In conclusion, for the same price as JetForm, there are many more features included with PerFORM. On calling a mail order retailer, I have found out that PerForm is in version 2.1. Its cost is substantially less than the list price indicated. It is $183 plus eight dollars for shipping. I have recommended PerFORM for the forms software, and have completed the requisition forms for purchase. I expect to receive the product by the end of the semester.

Documentation

Throughout the course of the semester, I have had meetings with certain members of the CPPO and The Computing Center. The minutes for those meetings are contained in the following pages.

Benefits Obtained Through This Project

Looking back at the project, there were many things that I learned and things that were reinforced during this semester. While starting the project, I foresaw many of these benefits. But now at the culmination, I have found that there are a few more additions.

The first benefit was the experience of being able to examine other programmers coding style and to use some of their techniques to expand my own. Of course, under this system there was some limitation to the expression of style that a programmer could exhibit. The limitation was that all system modules were built with a similar structure. For instance, the procedure format was as follows:

```
0000-MAINLINE
1000-PREPARE-SCREEN-OUTPUT
2000-DISPLAY-SCREEN
3000-EVALUATE-PFKEYS
4000-TRANSFER-CONTROL
90100-GET-DFHCOMMAREA
90200-PUT-DFHCOMMAREA.
(*Ninety thousand level procedures contained the embedded SQL.)
```

Much of the code within these procedures is now being produced by a code generator; so it will be very similar in structure. And the structured format should aid in maintainability by offering recognizability which will help the programmer locate an area of the program that gets the update. Aside from this style limitation, there were still many coding styles to observe. To name a few, they were the person's use of two dimensional arrays, a coders's means of implementing a page "forward" or "backward" and the individual's use of certain COBOL commands such as the STRING statement, the EVALUATE statement, and form of the dynamic call.

Another benefit obtained was the experience of the integrating modules into one load. There are the standard issues reinforced that are related to COBOL linking. The calling program must have the passing variables declared in WORKING STORAGE but not in the LINKAGE SECTION. (The driver has no LINKAGE SECTION.) The CALL statement in the calling program contains the using clause which specifies the global variables.

```
WORKING-STORAGE SECTION
    .
    .
 01 DFHCOMMAREA.
     05 FIRST-50-BYTES          PIC X(50).
     05 SECOND-50-BYTES         PIC X(50).
     05 THIRD-50-BYTES          PIC X(50).
    05 FOURTH-50-BYTES          PIC X(50).

PROCEDURE DIVISION.
   MOVE 'CPPO0010' TO CALL-PROGRAM-ID.
   CALL CALL-PROGRAM-ID USING DFHCOMMAREA
   CANCEL CALL-PROGRAM-ID
```

The called program contains a LINKAGE SECTION with the passed variables

```
LINKAGE SECTION.
01 DFHCOMMAREA.
    05 FIRST-50-BYTES          PIC X(50).
    05 SECOND-50-BYTES         PIC X(50).
    05 THIRD-50-BYTES          PIC X(50).
   05 FOURTH-50-BYTES          PIC X(50).
```

The procedure division indication specifies the passed variables and the program ends with a GOBACK statement.

```
PROCEDURE DIVISION USING DFHCOMAREA.
    .
    .
    .
    GOBACK.
```

Another valuable piece of knowledge gained was that relating to the virtual machine. Creating a multiuser, interactive system on a virtual machine required some research. The important points that are unique to the virtual machine are that each user has their own designated portion of memory. These portions of memory are built on top of VM. CMS is duplicated in each virtual machine. Additionally, the CPPO System would be resident in the virtual memory space of the users accessing it. The CPPO System would be redundantly resident in memory as many times as there are users running the system.

Similarly, the multiuser system design under VM was a learning experience. Since the VM operating system is not designed to support a multiuser interactive environment, there were several options that had to be investigated for user access. Exploring those options was informative.

An additional positive experience gained while working on the project came from the use of the debugger. The tool increased my familiarity with such a tool and helped to streamline my approach for locating errors. Given an error, the experience has helped me anticipate where to look for the cause. Or when the cause was unknown, I could use the debugger to step through the code and check variable values. My approach to debugging was to locate pertinent data, organize it in the relations, study the relationships, devise a hypothesis, run the program, check the output, then use the debugger to find the error.

The project also allowed me to develop my fact finding skills. There are many means to discover facts but my technique involved interviews with members of the CPPO. The purpose of the meetings was to clarify matters, verify understanding, generate enthusiasm, get the end-user involved and to solicit ideas and opinions. The personnel were able to further specify what the system should provide. Some of the facts uncovered during this semester are shown in the appendix of this paper under the meeting minutes section.

One other benefit acquired from the project was the further development of my decision making skills. Some of those decisions included, adding a STATUS field to certain relations, recommending a forms software and laser printer, changing the logic of CPPO0029, deciding what variables would be needed in DFHCOMMAREA, ect.

Another experience gained was seeing how a design change or a change in specification can alter the progress of the project. The client has a tendency to want to add features to the system as the implementation progresses, and the implementer discovers facts not found in analysis. Overall, I found that a change took more time to implement once the system was being implemented than if the change in specification occurs before implementation.

Implementing this system has also helped me further develop my communication skills. Working with people during the project, holding a biweekly meeting, meeting with my advisor, expressing changes to be made, doing fact finding, and working with people in technical support to resolve issues were activities that helped in this area. Throughout the semester, I had meetings with Steve Moore in technical support, to address the issues of database security and multiuser access. I also meet with Bill Miley from The Computing Center and some of the CPPO Staff every other week to cover new issues and discuss system progress.

In the project, I was also able to expand my knowledge of SQL database security. I was able to learn that it was possible to grant authority to a program so that a user could not access the database outside the system. Likewise, I was able to query the previously unknown SYSTABAUTH table to find authority details.

In progressing through the development of the system, I had a great many opportunities to refer to system manuals relating to SQL, COBOL, CMS operating system, and HP laser printer. The experience will prove valuable as it has caused me to seek out answers on my own which will reduce my dependence on others in the work force.

Furthermore, I expanded my understanding of forms software as I had to research what such a product does. I had to review certain products so that I could make a recommendation on which product should be purchased for the CPPO system. The same procedure occurred for a laser printer.

The project also allowed me to gain experience in testing. Although more testing will be necessary on the portion of the system I integrated, I was able to administer black and white box testing on individual modules and the integrated modules. I was able to plan and set test cases and anticipate their effects.

Another benefit obtained while implementing this system, was the use of a screen painter, XMENU. I was able to further develop my understanding and skill using the tool. The knowledge will be applicable at work with other screen painters.

The final benefit that I obtained while working on this system was the mindset of creating a system that is user friendly. A usable system is one that is user friendly were the interface with the users has similar conventions on screens through out the system. Such work involved making sure that the cursor goes right to the field where input is required, having the same PF keys perform similar functions in various screens, having input fields containing under-

scores ect. This is an important issue when creating a system. It is one that I will stress when working in industry.

Conclusion

To this date, the implementation has been completed to the point set out in the proposal. That point is the integration of an important subset of the CPPO system. Additionally, some important issues relating to the system were researched, and solutions were developed to those integral pieces.

In addition to my efforts, the students from the design class, SAN 475/575, have managed to further design other parts of the system and implement them. The student undertaking has taken further the student side, staff side and administrative functions of the system. On the student side, they have completed in modular structure the programs that complete student registration. On the staff side, they have worked on the programs that register an employer, schedule an interview, take room inventory, customize interview slots, present standard slots, view schedules, display information about a student and list an employer. Student work on the administrative side has added to design the programs that print daily reports, print management reports, perform the end of year functions, change password, create daily interview packets, record "no shows", create custom packets, suspend or reinstate students and determine room availability.

Despite these undertakings, there is still much work to do. A list of items that I have noted is as follows:

-integrate the remainder of the system,
-perform extensive testing on the finished product,
-design the system subset that creates a diskette version of the Placement Data Sheet,
-get with the CPPO to decide what will be the abbreviations for MAJORS,
-give this information to Bill Miley so he can use it to transform registrar's demographic data into the database,
-in the student entry area, incorporate a validation on a student major change,
-in CPPO0011, allow for minimum GPA if accounting major,
-set Backup & Recovery procedures,
-complete documentation on each module and give to Bill Miley who will oversee maintenance,
-create the Placement Data Sheets on the forms software,
-provide a flag indicator to show when a GPA field has been changed from that given from registrar,
-double check with Rich Hearin that there will be no overflow list,
-change system so that when student cancels an interview (and all slots are taken) that the interview goes to open status,
-show Open sign-ups on screen SCRN1140 from CPPO0014,
-allow a student to be on schedule when they do not meet the requirements,
-place time limit in canceling interview in CPPO0015 (9 A.M. the previous day),
-place deadline in taking an open sign-up. (1 P.M. the previous day),
-allow MBA's to bid on undergraduate major that they had,

-allow interdisciplinary majors to bid on their "area of focus",
-allow CPPO staff the ability to move other students into the unfilled interview slots for another position. For example, a company is interviewing for a full time systems job. All the slots are taken for this position. But for its summer internship position, only half are taken. The company may allow or permit the remainder of these slots to go to full time job interviews.

I would anticipate that the project can be further implemented by the student classes. It would also be helpful if another graduate student would take up the development as their graduate project. There is a possibility that a group of undergraduate students could do the same as their senior project.

The implementation of this project will proceed because the customer evaluation of the system has been positive. The director of the CPPO, Rich Hearin, has seen the prototype, and he has said that he likes it. Biweekly meetings with some of the CPPO staff have been held to obtain their input to the system. They have also seen the prototype and like it. So the implementation should continue.

Appendix

The minutes, figures and displays are shown in the following pages.

a. Minutes of Meetings

MINUTES FOR MEETING DATE: 9/17/92
Concerning the CPPO

Present: Rich Hearin
Bill Miley
Keith Weber
Joe Barry
Dr. Tom Schaber
Steve Peter

The two main questions that we had prior to the meeting were, where will the system run and who can support it.

The meeting began with a discussion on the merging of ACS and TCC (the Computing Center).
What exists now is the University Information Systems, which oversees Administrative Systems and supports all other university systems activity. Instructional Systems assists faculty and how they use the media.

Early in the meeting we were informed that UIS could support COBOL and that the CPPO System should reside on the academic side of the mainframe that which supports the CMS operating system. These two pieces of information are favorable because much of our system design was based on the mentioned programming language and operating system. As for the database, we indicated that we would be using SQL/DS, and that Steve Moore has expertise with the product.

In the meeting, I had called attention to my graduation in December. Rich Hearin asked how much of the project will be completed by that time? The answer is as much as possible. The project will be fully implemented by August 1993. It will be necessary for another graduate student or another class of Dr. Schaber to take up the project next semester. Rich hopes that implementation does not carry into August; he would like to use and test it. He may "test market" it on System majors.

It was asked, what will be the accessibility to the system. I said that system obtainable through any terminal on campus, but most notably for students, terminals at Kreger and Hughes would be most popular. Add on features to the system may include an additional menu option at the networked microlabs. Rich Hearin mentioned that system may want to handle modem connection.

I brought up the issue of how can a interactive multiuser system be implemented in a CMS environments. A possibility was explained such that there could be multiple users on one account and that there would be a maximum of "N" number of accounts.

Rich Hearin asked how the Placement Data Sheets will be added to the database and whether that could be done by scanner entry. I mentioned that the students will have the data entered via screen fields in the interactive system. We agreed that the CPPO would like the output capability which would involve a laser printer. This output portion of the system has yet to be written. In addition, Rich remarked that the CPPO can save several thousand dollars a year if it can produce a diskette version of these Placement Data Sheets that they sell to employers. Currently the CPPO has to contract this service to an

outside firm; what they receive is the Placement Data Sheets themselves. Linda Smith handles the contact with this firm.

The issue of Security was brought to attention. Rich stated that he wouldn't want students being able to generate additional points ect; he wants the "fairness kept in" the interviewing process. We assured him that this was the most important point, and that we will test the system for such defects.

A question brought forth was, will there be help screens. Our answer is yes, but who will put the text in the system is another issue. Maybe we could receive some help from those at the CPPO.

Rich asked what should he be planning for his equipment. It was mentioned that someone form Debbie Allision's group could work with him on this. Hardware people can assist with interface considerations for the CPPO personel. They can offer trainning, problem resolution, and equipment repair.

I asked (relating to our database) if there were any problems in obtaining student demographic and grade data from the Administrative data that is held. The answer is yes, it is just a matter of getting the permission from the student to release the infomation. It would be satisfactory to have an entry field that says, "by typing your name here, you are giving your support to release this information." Such a feature will reduce the time it will take for a student to register in the system therefor reducing the number of people on the system, and it will also releave the Registrar from having to satisfy student requests for GPA information. The data would be downloaded from the administrative data to tape and input to the CPPO system database via tape.

We will have to determine how this demograghic and grade data will be obtained or added for transfer students.

A dropped CPPO system requirement is that of literature distribution. The system will still indicate that company literature is available and would be helpful during the interview. But we will no longer have to incorporate in the database a field indicating whether a student came by and picked up information about the company.

However, the "Prenight" must have a different key to acknowledge.

Bill Miley requested a Project Schedule.

Meetings: Initially, we'll have one every two weeks - Thursdays at 9 A.M. The next meeting is October 1, 1992.

The meeting concluded, and a tour of the mainframe equipment was given.

Time of this meeting: 2 hours.

MINUTES FOR MEETING DATE: 10/1/92
Concerning the CPPO

Present: Joe Barry
Bill Miley
Steve Peter

The diskette version of the Placement Data Sheet (that is sold to employers) will require an additional program to read and write data to what may be a VM account. We could then use File Transfer to bring to a Personal Computer.

A hardware meeting is scheduled with the appropriate CPPO personel and Debbie Allision.

Concerning demographic data: Bill needs a list from me as to what information is needed to pull from the demographic data and the timing of it (how often; eg. twice a year). Keith needs permission from the Registrar to extract the data. He would submit a cover sheet and obtain Ken Bogard's permission.

Then there is the issue of when a student allows you to extract data then wants to revoke the permission. We also will need to account for the situation where a student enters demographic data, yet gives permission to extract data. Do we have the entered data wiped out?

Bill recommends that in the database, that all date fields have four digit years. Tables that include the same data should be given the same name.

We will have to include data for Minimum GPA. Because companies have the capability to state a "Prefered GPA." But in accounting they are allowed a minimum GPA.

The Plus/Minus grading system will not effect our database.

The database does not contain a personal identification or password. Will need an administrator to look-up passwords or to change passwords if the password cannot be read. How will it be handled, by phone call or personal visit. We also have to account for the initial logon; will the password have an initial value or will the user enter a value. If they enter a value they should enter it twice.

Bill asked if we wanted to our online system information regarding date/time/operator/terminal of last date of change. This could be used for student tracking for such claims that data was not entered in such a way.

Additional system requirements will include that of backup and recovery logic. Should backup occur once a day or after every transaction. A determination needs to be made on what data needs backup and when it should be performed (eg. before bid processing or before update scheduling). There most probably is a transaction log maintained by the system. Check with Steve Moore on this.

NOTES from phone call. DATE: 10/20/92
Concerning the setup of Multiuser Environment.

Parties: Steve Peter & Steve Moore

Steve Peter called Steve Moore to ask him to implement the third choice from our last meeting that uses a rotary time access to one of the VM accounts.

S. Moore said that he would introduce this to his manager. He said that he would probably need to get the principle people involved in a meeting that would cover options so that the investment of time is warrented. They would want to make sure that we are serious about the CPPO project. I assured him that we have made a commitment to the CPPO for this system. He said that if aproved (work to alter the operating system), that implementation would take just a few days.. There would be the examination of the operating system and the development of the system modifications. The modifications would have to be applied and tested.

October 12, 1992
Meeting with Steve Moore
to Investigate How Users
Will Access the CPPO System.
==========

The base level portion of the operating system is the Control Processor (CP). CMS is built on top of the CP. The CP allows jobs to have a time slice, and in a sence, allows more than one job to run at a time. This is done through the partitioning of memory into its virtual segments. This virtual concept applies also to disks and terminals.

CMS on the otherhand, will not allow a single user to run more than one application at one time. CMS allows users to access packages and edit files, run programs ect. Since CMS is built on CP, multiple users can be running the same application at the same time.

In addition, SQL allows multitasking; it has the capability to take care of locks ect. to maintain system. It can control concurrent access.

The Virtual Machine Connumication Facility passes messages from CMS to the CP which may go to various applications held active like SQL.

LOGON Procedures
----- ----------

We will alow users to logon, register with the system and allow them to access the context operation environment. They will not be allowed to escape to CMS where they could launch another application. The application security must prevent users from being able to communicate with CP. If they are able to IPL (which I can't see where they would in our system) then they must be sent right back into the CPPO application.

There are three means to implement the logon process.
1) The easiest means would be to have "N" accounts with userids ranging from CPPO0001 .. CPPOOOON. The advantage of this method is that it wouldn't require very much additional work from the techical support staff in implementation. The disadvantage to the user may be that they may have to attempt several userids until a free one is found.

2) The second would involve the dedication of terminals. Perhaps terminal could be set at Kreger, Library and the CPPO. Those terminals would already be logged-on to the CPPO System and would be active. The advantage of this plan would eliminate the logon conflict. The disadvantage of this approach is that if the system goes down, there would have to be an operator that would need to launch the application from the terminal.

3) The third technique would involve a Text Based Information Display. Here the user would know the name of the application and present it at the userid entry field. Behind the scene, the operating system would find an available Virtual Memory Segment. The advantage of this means would be that it would be easy for users to logon to the system. They could access from almost any terminal on campus or through modem. The disadvantage is that it would allow more work on our techical support people, and they would need to get approval to spend time toward the

project.

Two Notes in Conclusion:

There are two levels of security: SQL security & Application security.
Once the system is fully implemented who will maintain it?

MINUTES FOR MEETING DATE: 10/15/92
Concerning the CPPO

Present: Joe Barry
Bill Miley
Steve Peter

Bill Miley called attention to a new possibility concerning the adding of "EMPLOYER" data to the database. He said that it could be poosible for the CPPO personel to key in employer data as they do now on their WANG OAS system. The systems support could then on demand upload the new data.

Joe Barry is checking on the number of digits required in the employer number since there are some 2500 employers listed at the CPPO. Currently though the CPPO's system uses a three digit number.

Joe is also looking into how they want to present the GRAD_DATE on screen SCRN1121. The question is: what is easiest for the user. Is it easier to understand M/93 or 05/93. Discussion continued on the storage of this field in the database as a four digit year.

The new database design was presented to Bill and Joe.

The outcome of the meeting related to "Multiuser Access" with Steve Moore and Steve Peter was covered. {See meeting with Steve Moore} I need to contact Steve Moore to check the possibility of option three and set a time on its implementation.

There was a question in our last meeting that Joe Barry checked on. It concerned the situation where a student forgets their password. The solution requires the student to come to the CPPO and see the Administrator (which may be Rich Hearin). Bill recommended that there be two Administrators.

As for maintenance after implementation, the undertaking shall be handled by University Information Systems. A Request will have to be made for such services. Stearing groups will decide which system receive priority.

Bill will provide me with what he is would like for General Documentation.

The matter of the need for FORMS SOFTWARE to print the Placement Data Sheets was expressed by Steve Peter. Bill mentioned that some of the existing Lasers have a Forms Definition Language. One example of a document printed by FDL is the annual W2's. The University Information Systems has an "Ion Printer", and they print some items for the CPPO at this time. Perhaps the Placement Data Sheets could be printed at the UIS.

MINUTES FOR MEETING DATE: 10/26/92
Concerning the Multiple Access to the CPPO System.

Present: Steve Moore
John Kinney
Tom Schaber
Steve Peter

John Kinney felt as though it is important that we address the issue of multiple access properly so that problems can be eliminated, and that any inherant problems with the CPPO System do not become a relection on those as ACS.

He felt that there would be difficulty with the first time user logging on to the system via remote logon. Tom said that we will then consider the Remote logon a bonus (not a feature in our system).

It was mentioned that there would be a problem with the VM Rotary Dial Service. That problem requires a change to the Operatiing System which is something that John would like to avoid.

Instead he recommends issuing accounts to CPPO users. There would be about 3000 CPPO users.

There are problems with the 3000 account design.

1. Who will generate? CPPO? That means the CPPO must get involved with the management of these accounts. There would be two types of accounts in this design. Some of the 3000 will already have accounts and some will not. Those with accounts will use there same account and will not get a CPPO account. The others would get a CPPO account.

The CPPO would get a list of account names from ACS and they would note whether a given account goes directly into the CPPO System or whether they can go into the system from the account they already have from their course of study. Then there is the additional task to the CPPO to handle people who forget their password.

2. The CPPO system as it is designed now uses Static Calls. If there are 100 CPPO virtual users with static calls on the system, it could be a drain on the system.

Whether we go with Rotary Accounts or Individual Accounts there is a security issue involved. We must prevent users from having access to read or update the database from outside the CPPO system.

I can see how security could be important to the person who has an account from another course of study but for those CPPO accounts, I do not see how someone could break out of the CPPO System.

We are not sure whether it is possible to issue authority to change the database only through the programs and not by one's account. Do we Grant Authority Public to avoid the tedious issue to individual accounts? An investigation is needed.

MEETING TIME: 1.5 hr
MEETING TO CONTINUE: Weds. 10/28/92

MINUTES FOR MEETING DATE: 10/28/92
Concerning the Multiple Access to the CPPO System.

Present: Steve Moore
John Kinney
Tom Schaber
Steve Peter

Tom had good news. I was there to observe his check on database security. He created a module to access a database relation. He GRANTed authority of the relation to the program (and not to any students). The result is that the module runs and can access the relation but the student cannot when out of the program.
This means that the account that creates it can GRANT access to the modules. Therefore, no individual (except the DBA) will have authority to access those tables. The only way that the security of the database would be in jeopardy is if a person breaks into the DBA's account.

As for user access, Barb Edwards has (prior to our concerns) been working on a policy where all students will be issued accounts from the point were they enroll in the university to the point that they leave. This means that all CPPO applicants will already have accounts.

Another issue brought up was whether the current system design of Static calls will present a problem with memory space usage. The question was asked, how many lines of code are there? There are about 50 program modules and 50 screen program module each with 2000 lines of code. That's 200,000 lines of code. It was mentioned that I look into what it will take to utilize dynamic calls.

MEETING TIME: 25 minutes

MINUTES FOR MEETING DATE: 10/29/92
Biweekly Meeting

Present: Linda
Mary Alice
Joe Barry
Bill Miley
Steve Peter

Bill requests the specs on the STUDENT Table. I told him that the database has taken on changes (even this week). I think that after these changes, that it may now be appropriate to indicate the demographic data that will be needed from the registrar.

Bill asked how will it be determined what students get downloaded from the registrar. Shall that be all Seniors and Juniors or what. The CPPO will provide this information.

Bill mentioned that it would be nice if there was an additional menu option of the CPPO System from the MicroCenter computers.

Bill has asked for a schedule of events for the project. I told him that I am revising our database reloading facility now. In the next weeks I will be working to make our system work with dynamic calls (not static as it is now) and a study on Forms Software. I expressed that I thought students from SAN 475 would be taking an active role about this time. In a meeting this week, the system size was discribed as being about 50 modules. I have six modules completed which are related to checking a schedule, obtaining information on an interview, placing a bid, bid processing and selecting an interview slot.

Joe asked and stressed that the CPPO would like "teacher candidates" to have the capability of accessing the system via a branch campus. There shouldn't be a problem with this if the branch campus has access to the network.

Joe mentioned that students need the capability to change the GPA field. Need this option for transfer student.

Mary Alice pointed out that the system should be able to produce an EMAIL message to those students effected by a late cancelation of an employer. It was mentioned that a first attempt is made to call the students. All we would need is to provide the userid's of the students to were the email message should be sent.

Linda remarked that should be able interviews in which there are no bids, just a sign-up process. (eg. interviews for Peace Corps, or company that sets up an interview date to soon for the bidding process to occur.) Linda will be helping us by providing a list of exceptions as soon as she possibly can. (Exceptions like: handling Alumni that are not registered for closed interviews.)

Mary Alice stated that it would be nice if we included in the system a screen or portion of a screen that will list a "Job Discription." Not every position has a job discription. A job discription may be a paragraph or a full page.

The question was asked whether a company could issue the same password

to students interviewing for the same position? Designers will ponder this proposal. But the CPPO needs to come up with a policy to handle closed interview violations.

It was noted that our system could be used to handle "the Big Six Night."

NEXT MEETING IS: Nov. 12, 1992

MINUTES FOR MEETING DATE: 11/12/92
Biweekly Meeting

Present: Mary Alice Grassmick
Linda Smith
Joe Barry
Bill Miley
Steve Peter

It was asked whether a student will be able to check the VISIT schedule by date. It was also mentioned that it would be great if the list could be seen from both a date order and a alphbetic order in the system. I explained that the design is order by date.

Joe stated that he could get students for testing, maybe those students who have accepted offers or some other group. I said that would be an excellant idea. This type of testing is month away though. This type of testing may be useful in April or May.

Another thing needed with the GPA field is a flag. This data for this field will be originally obtained through the registrar. It would be nice to know when a student has changed this field. Otherwise we would need to compare this field in the database with the field in the original sequential file obtained from the registrar. (or add another field to database called ORIGINAL_GPA

Cut off times: A student can cancel an interview up to 9 A.M. the day prior to the interview. The lastest a student can sign-up for open sign-up slots is up to 1 P.M. the day before the interview. The deadline is needed to give preparation time for the next day's interviews. We need to make sure that when a student cancels an interview that another student cannot grab that slot that has become open. Because there is an Overflow list that should be contacted for those slots. This maintains the "fairness" in the system. Those that notify early and get on the overflow list should be the ones that get the opportunity in a last minute opening. If it were the "first see, first get" situation then we might have a problem of Fraternity/Sorority (or other groups) control (obtaining interviews for friends, canceling ect so they can get the interview).

In printing, we need to make sure that staff will be able to print a specific student's data sheet.

Clarifications to the "RESPONSE TO QUESTIONS" dated 11/11/92

#4. The student usually initiates the contact with the company in such a case. Students will be told by phone or letter. The student will then notify the CPPO. So we will monitor this loosely. We will take the students word for it. If the student is found to misrepresent the truth, then they will face a penalty from the CPPO. There will be a need to modify the number of slots that a interview may have. About 90% of the companies keep the slots as planned. Some companies add and some delete the number of slots. There was a case recently were a company had to move a few of its earlier interview slots to later in the day (after the previously scheduled last time slot). How can this be handled? We will have to add this feature to the system.

#5 Need overflow list. There are students on the overflow list that do not bid. Students must meet company requirements. There must be "print" capability. See "fairness" issue above.

#6 Staff need the ability to check the information that they have just entered. This can be through a view (by screen) or by printout.

#8 Cancel interview up to 9 A.M. the previous day.
Open sign-ups end at 1 P.M. the previous day.

#9 on SCRN2320, the field "Winners Must Schedule By" should be renamed to "Open Sign-ups begin."

#10 A correction was made to the stated group of student who will have logon capabiltiy. That group was stated as Juniors and Seniors. It actually is Seniors and Accounting Juniors. Others will have to contact the CPPO.

#11 Solution: The field in VISIT relation called ADDITIONAL_REQMTS will contain a note similar to this: "Company requests that you interview with only one of their divisions." There is a limit on the length of this field though. A situation arrises where a student places bids on the two different divisions and wins both but can only accept one interview. The way the system is designed, the student will spend points on the interview that they cannot take. They will have the see the CPPO if they care to recover these points.

Bill and Steve went through the Student Relation and noted those fields that can be obtained from the Registrar. Some of the fiels are questionable, so Bill is checking the Registrar's data.

NEXT MEETING IS: Dec. 3, 1992; 9 A.M.

Notes: 11/12/92

TO: Joe Barry
Mary Alice Grassmick
Linda Smith

From: Steve Peter

With the flag field that was presented in the meeting today, we need to know if this is something that will get a fair amount of use to warrant its addition to the system. How often would it be needed? Without it in our system, someone like Bill Miley could be contacted and asked if the student has changed the GPA field. That person probably give you an answer back probably by the next day. All that would be involved is comparing the GPA that is in the database with the original sequential file that was obtained from the Registrar. I'll send Bill a Note to see if this is a task that his department would like to avoid. And tell us if you would like the system to provide you with that information. If so, how would you like the information to be provided to you? By screen or report.

In regard to CUT OFF TIMES, when a company has three days of interviews for the same position, will we have three different cut off times or just one based on the first day? From the development side, it would be easiest if the cut off times were to based on the day of the interview. Is this the best for you?

On the topic of the Overflow list, this is not in our system at this time. When the issue came up we thought that we could use the students who place bids as a guage of interest. If you think about the system as it is now, and ask yourself why somethings are the way they are, you may conclude that the system has evolved to meet the problems associated with an inability to judge student interest at the last moments while keeping the system "fair". Maybe you do not agree but lets see. It seems like you still would like to call the students so that you are sure to fill the slots. Is that correct? So you need a list. What would be the difference between the overflow list as it is now and getting a list based on the bid losers? This list could be presented in order by points bid, or by date and time of bid. If this list would be based on order by date and time, it would be very similar to the overflow list with the exception that the student did not have to put the extra effort into getting on the list as they would under the overflow method. We did discuss that there are those who go on overflow that do not bid. But with the loser list method, students will have to plan ahead and make sure that they place a bid on the company (putting in effort and showing interest in the company). With the overflow method, how "interested" is a student in a company if they do not place a bid? Of course there is the situation where a student is down to their last couple hundred points or have no points left. How can they become overflow students if the list is based on bid losers ranked by bid points? True, but such a student has shown alot of interest in many other companies, and they have apparently had some use of the CPPO facility (more than most students). How fair is that to the student who has hardly used the facility, has plenty of points and meets the company requirements? This is quite interesting. There are many

ways to design the new system.

In conclusion, the options are:

institute an overflow list into the system,
use the losing bidders ranked by date and time,
use the losing bidders ranked by amount of bid,
or have a system where there are no "open sign-ups" and use the next bid loser with the next highest bid amount for the open sign-up, then the ones left after that can be used for overflow, ect.

The advantage of using the losing bidders for overflow is that we would be minimizing the amount of data produced and needed by the system. It would be more efficient. We would be using the minimum amount of data required to run the system.

The disadvantage is that it is different from the way the system is now. Tell me what you think. Feel free to leave a message on my recorder or send me a EMAIL message. My userid is SPETER. Thank you.

November 11, 1992
Response to Questions
==========

1) WILL ONLY THOSE STUDENTS WHO MEET THE REQUIREMENTS OF AN ORGANIZATION BE ABLE TO GET ON AN OPEN SCHEDULE?
Yes, those students that meet the requirements of certain companies will see those companies on Screen 1.1.2. [See Figure 1]

2) WILL WE BE ABLE TO CONTROL WHEN SIGN-UPS STOP FOR A PARTICULAR SCHEDULE?
Yes, see Figure 2. This screen can only be accessed by CPPO personel. The last two entry fields will control the last sign-up date. Once this is entered, we have not planned for a change in midstream.

3) WILL WE BE ABLE TO CONTROL WHEN A SCHEDULE GOES OPEN? Yes see Figure 2. After the date entered in the third last input line, the system will allow the interview to go open if slots are available.

4) MANY TIMES A STUDENT IS TOLD BY THE ORGANIZATION THEY CAN BE ON A SCHEDULE WHEN THEY DO NOT MEET THE REQUIREMENTS. HOW WILL THEY BE ABLE TO GET ON THAT SCHEDULE. We have not worked this into the system. Before we add it to the system I'll need to know more about the following. How are the students going to be told? By letter or phone call? How closely do you want to monitor this? We could probably work it in similiar fashion as the closed interview.

5) WHEN A SCHEDULE IS FILLED, HOW CAN STUDENTS SHOW THEIR INTEREST IN THE ORGANIZATION? (WE NOW HAVE OVERFLOW LISTS). WILL DATA SHEETS OF STUDENTS ON OVERFLOW ALSO BE PRINTED OUT. ALSO, WILL THE STUDENT BE REQUIRED TO MEET THE ORGANIZATION'S SPECIFICATION? In our early design we proposed printing all students who bid on an interview. But now we have planned to print the Placement Data Sheets needed for interviews. We can make a modification here. Would you like it if we printed the top certain percent of bidders? What should that percent be? Or should we have every bidder for an interview printed?

6) WE NOW HAVE A RECOVERY DECK TO USE IF AN ERROR HAS BEEN MADE WHEN ENTERING INFORMATION. WILL THERE BE SOME CHECK/BALANCE TO BE SURE INFORMTIONIS ENTERED CORRECTLY. Yes, there is an error check on entry fields except for student entry fields related to the Placement Data Sheet.

7) WILL STUDENTS BE ABLE TO VIEW A LISTING OF ALL ORGANIZATIONS THAT ARE SCHEDULED OR WILL THEY BE ABLE TO SEE ONLY THOSE SCHEDULES FOR WHICH THEY ARE QUALIFIED? [See Figure 4] Yes, option four will provide that service.

8) IF A STUDENT WISHES TO CANCEL AN INTERVIEW, HOW WILL IT BE HANDLED? ALSO, DURING WHAT TIME FRAME MAY AN INDIVIDUAL CANCEL AN INTERVIEW?
I didn't get a screen print for this one but there is an option for a student to cancel an interview. But to my knowledge, we have not placed a time limit on the cancel feature. What would you like?

9) OCCASIONALLY, BECAUSE OF A SHORTAGE OF TIME, AN ORGANIZATION WILL SET UP A SCHEDULE AND IT WILL BE FOR OPEN SIGN-UP ONLY. WILL SIGN-UPS BEGIN AS SOON AS IT IS ENTERED IN THE SYSTEM, OR CAN A DATE BE SET FOR OPEN SIGN-UP TO BEGIN? Yes in Figure 2, to have an interview become

initially open, you will have to enter "today's date" in the last two input lines: "Last Day to Schedule" and "Winners Must Schedule By."

10) HOW WILL INTERN, OTHER THAN ACCOUNTING, SCHEDULES BE HANDLED? WILL THE SIGN-UPS BE DONE MANUALLY IN THE CPPO? ALSO, INCLUDED IN THIS GROUP WOULD BE THE PEACE CORPS, BOY SCOUTS OF AMERICA, UNIVERSITIES, ECT. Is it OK if we use the same employer number (for that given company) and a unique schedule number? We plan on giving all Seniors and just Junior Accounting and System Analysis majors the logon capability (a change recommended by Dr. Schaber). They will have to enter the data for the Placement Data Sheet. Interns less than Junior will require a physical addition by the CPPO staff. The addition will involve adding a social security number and name.

11) WE NOW HAVE COMPANIES COMING WITH SEVERAL DIVISIONS AND ASK THAT STUDENTS INTERVIEW WITH ONLY ONE DIVISION. HOW CAN WE CONTROL STUDENTS PLACING BIDS OR "OPEN SIGN-UP" OF MORE THAN ONE DIVISION. FOR EXAMPLE BANK ONE OR NCR. If there are two different schedules there is no easy way to implement this at this point. This is a substantual modification, and work on this will delay implementation. Perhaps we can place in the next version.

MINUTES FOR MEETING DATE: 11/23/92
Concerning the purchase of forms software and laser printer.
Present: Rich Harin
Joe Barry
Steve Peter
Linda Smith

Went over the procedure for purchasing forms. Steve took "Requisition Sheet" to fill out.

Found out that the CPPO has just received a HP Laser 4M.

Rich wants to know how students can print their own data sheet. I explained to him that the lab is equiped with "pay for print" lasers. The only problem is that these lasers will not possess the forms software that will have the form image. How will students obtain extra data sheets to distribute to employers?

Well, they really won't have a need to print the form. A student may want to print the output that would be on the data sheet so that they can verify it. We will make sure that they have that capability. As for company distribution, students can use their own personal resumes.

Linda Smith has presented the following questions:
WE HAVE REQUESTS OCCASIONALLY FROM COMPANIES RECRUITING FOR MASTERS AND BACHELORS (EACH HAVING A DIFFERENT SCHEDULE). IF ONE FILLS UP AND THE OTHER DOES NOT, WILL IT BE POSSIBLE TO HAVE THE OVERFLOW FROM ONE GO INTO THE OTHER.

We really haven't determined how we are going to handle overflow in the first place. There are many ways that we can handle overflow as covered in our last coorespondence, and the overflow procedure is usually handled manually. The only question is "how will the overflow list be determined?" I mentioned this to Rick and Joe moments earlier. It is something that will be determined.

WITH THE SAME IDEA IN MIND, WILL WE BE ABLE TO APPLY THE SAME CONCEPT TO THOSE INTERVIEWING FOR INTERNSHIPS AND FULL-TIME POSITIONS? Same answer as above.

WILL INTERDISCIPLINARY MAJORS BE CODED FOR BIDDING WITH THEIR "AREA OF FOCUS?" We'll have to put this in the system. First the student will have as their major "interdisciplinary studies", then we need to make sure that they have an area for them to indicate their "area of interest." Then the CPPO personel or the student themselves will enter a three digit code related to this area of interest. These codes are on a form that I obtained in the meeting.

WILL MBA'S BE ABLE TO BID, OR SIGN-UP THROUGH "OPEN" SIGN-UP USING THEIR UNDERGRADUATATE DEGREE (AS THEY CAN NOW)? We will have to make sure that they can.

MINUTES FOR MEETING DATE: 12/03/92
Biweekly Meeting

Present:

Mary Alice Grassmick
Linda Smith
Joe Barry
Bill Miley
Steve Peter

Discussed overflow. Determined that there would be no overflow list.
a late cancelation will leave a slot open but
"that happens anyway."

Program CPPO0015 should now allow a cancelation after all slots are filled because it will go back to open sign-up.

Will company be able to change things in midstream sonce some students have bid. For example: open bid to all. To open to May graduates.
to allow half masters, half interns.
There are just 2 or 3 companies tht cause exceptions

Bill Miley gave me the registrar's major codes which are two digit numeric. The CPPO uses there own 3 character abreviation.

NEXT MEETING: DECEMBER 17, 1992.

MINUTES FOR MEETING DATE: 12/17/92
Biweekly Meeting

Present: Rich Hearin
Mary Alice Grassmick
Linda Smith
Joe Barry
Bill Miley
Steve Peter

Discussed my project progress.

The question came up: Is there another graduate student going to take over the project?

Issue of codes for major was brought up. Codes for register are 2 digits numeric. CPPO uses an abreviation for the major.
eg. TEN for english teacher
TSX for secondary certified teacher
EGR is shown by the CPPO as MFE.
and when students enter, we need to validate their entry.
Maybe we should have the student just enter and not worry about the register information on major.
We will then have to display to student a list prior to entry.
We could have student enter a numeric code and then transfer that to a three character code.

Rich felt that there may be a need for staff to get in and change student major. For example. MBS. a masters in business. They should be allowed to interview in their undergraduate degree. It was mentioned that maybe there could be a question to the user: What was your undergraduate major?

How are students going to get there points in the beginning? Expected grad date will be obtained through registrar. The student will be able to change this info.

Graduates get:

December	7500 pts.
May	10000 pts,
Education	10000 pts.
Accounting Interns	5000 pts, may have to

consider GPA for accounting interns at a future date.
Then there are those situations where a student graduates in May and takes classes in the Fall. Staff will have to be able to award points.

Note: need to be able to restrict Junior graduates from getting those companies that they are not eligible to bid on.

The staff need access to info on the computer information form and the Student Placement Data Sheet.

The question was brought up: Do we have enough terminals to support thi: system? There are about 2500 students. Is there enough hardward available so that students can register and input data? "What they don't need is a system that works, but people can't get to."

There is a survey that is given to intership applicants. (See attached

form) The information it includes is: student name, phone number, major, name of organization, location, name of official to contact for information, company address, company phone, type of interhip, describe duties (6 lines), a question (Was internship paid or non-paid?, salary. This information would not need to be in a perminent database. It could if we want it to be. But staff said that they would be happy to print and file. They would like to be able to know how many students had interships. Reason: To let other students know where the interships were.

THIS IS THE FINAL MEETING FOR STEVE PETER.

INTERNSHIP SURVEY

If you have had an internship, please complete this internship survey form and return it to the Career Planning and Placement Office when you submit your registration materials. We would appreciate it if you would list any internships you may have had, regardless of the type of organization. Additional forms are available in the Career Planning and Placement Office. This information is kept in our Career Resource Center and used as a resource for other Miami University students looking for internships. We appreciate your cooperation very much.

*  CPPO0010  -  COMPANIES INTERVIEWING FOR MAJOR.
*****************************************************************

 IDENTIFICATION DIVISION.
 PROGRAM-ID.   CPPO0010.
 AUTHOR.       ROGER TATE.

*MAJOR MODIFICATIONS 10/92 STEVE PETER
*  CHANGES THAT NEED TO BE DONE:
*     GET THE "LIKE" FEATURE TO WORK WITH HOST VARIBLE IN QUERY.
*     MAKE SURE THE QUERY ON VISIT IS IN ORDER BY DATE
*         SO STUDENT SEES LIST IN ORDER BY DATE
*                                        11/12/92 S.PETER.
*
*
* PROGRAM FUNCTIONAL REQUIREMENTS:
*
* DISPLAYS COMPANIES THAT THE STUDENT IS ELIBIBLE TO BID ON
* BASED ON THEIR DEGREE, MAJOR, GRADUATION DATE
* AND CLOSED STATUS.  ALLOWS USER TO SELECT
* THE EMPLOYER THAT THEY DESIRE TO BID FOR OR TO JUST SEE
* ADDITIONAL INFORMATION ABOUT THE COMPANY.  RECEIVES
* STUDENT SSN FROM CPPO0001 AND PASSES COMPANY # AND
* SCHEDULE # SELECTED BY THE USER TO CPPO0011.
*

* PROGRAM FUNCTIONAL REQUIREMENTS
* Insert a listing of the program's functional requirements here.
*
*  Accept an employer number, schedule number, and student ID
*  number from the calling program.  Access the CPPO schedule
*  and display the corresponding schedule information.
*
*  Accept an amount of bid points to be submitted.  Add the
*  bid or change an existing bid to the amount specified.
*  Delete an existing bid if 0 is entered.
*
*  Update the student's bid points remaining.
*
*  Assumption:
*
*    Any bids submitted will be valid; invalidity of bids
*    will be checked by the calling program.

*MODIFIED
* PROGRAM FUNCTIONAL REQUIREMENTS
* This program will diplay the bid results to the student using
* screen 1.1.4 View Bid Results. The results to be displayed
* include employer name, winning bid value, student's bid value,
* and the student's scheduling status. The input to this program
* will be the student's social sequrity number from CPPO0000.
* from this key value, the program can retrieve the bid results.
* The values produced for the screen are the outputs of the
* program. The Student ID and Company Name will be transfered
* to program CPPO0015.

*****************************************************************

 IDENTIFICATION DIVISION.
 PROGRAM-ID.  CPPO0015.
 AUTHOR.      JR2GSANU:J Rawlings.

*MODIFY LIST:
*MODIFIED 10/92, STEVE PETER; EMBEDDED STMTS,DYNAMIC CALLS,
*                GOT IT TO WORK WITH OTHER MODULES.
*MODIFIED
*MODIFIED
* PROGRAM FUNCTIONAL REQUIREMENTS
* This program uses the INTERVIE and EMPLOYER tables.
* Variables passed to this program are SSN,EMP_NO and SCH_NO
* and they are already in a "validated" state.  Control is
* not passed to this program if the student is invalid or
* unable to meet requirements for the interview scheduling.
* This program only assists in selection/de-selection of
* interview DATE/TIME based on EMP_NO:SCH_NO.
* Data sent back to the calling program (CPPO0014) would be
* SSN, EMP_NO, SCH_NO, INT_DATE, INT_TIME.  A subroutine exists
* for sending and updating bid STATUS codes.  These codes assist
* in informing as to whether the student is signed up 'N' or  as
* to whether he/she has cancelled 'X' his/her interview.
*
* Group members assigned to this 'Backbone' program:
*               MC37SANU
*               KA0HSANU
*               JG11SANU
*
*          Last revision: 25 NOV 1991
*          Total Hours:   36
